

Shunesein

Tea Leaf & Fried Bean Manufacturing Management System

USER MANUAL

Version 1.0 · July 30, 2026

Covers Dashboard, Master Data, Procurement, Sales, Inventory, Delivery, Finance,
Access Control, Audit Log, and a detailed reference for every Report.

Table of Contents

11.4 Sales & Delivery Reports	22
11.5 Financial Reports	23

1. Introduction & Getting Started

Shunesein is the management system for a tea leaf and fried bean manufacturing business. It brings together purchasing, production, inventory, sales, delivery, and finance into one system so that stock levels, customer/supplier balances, and the company's accounts stay consistent with each other automatically as day-to-day transactions are recorded.

1.1 Logging In

Open the application in your web browser. You will see the sign-in screen with fields for **Username** and **Password**. Enter the credentials your administrator has given you and click **Sign In**.

- If your account has been deactivated or suspended by an administrator, sign-in will fail even with the correct password. Contact your administrator if you believe this is a mistake.
- There is currently no self-service "Forgot Password" flow. If you forget your password, ask an administrator (someone with the Manage Users permission) to set a new one for you from the Users page.
- A session stays signed in for one day. After that you will be asked to sign in again.

1.2 Finding Your Way Around

After signing in you will see the main application shell: a navigation sidebar on the left, grouped into sections (Overview, Master Data, Procurement, Sales, Inventory, Finance, Reports, and Access Control), and the active page's content on the right. Click any item in the sidebar to switch pages. Click your name in the bottom-left corner to edit your display name and timezone, or to sign out.

The very first time you sign in from a new location, the system may prompt you to confirm your timezone so that dates and times displayed to you (order dates, report periods, timestamps) are shown correctly for where you are.

1.3 Roles & Permissions

What you can see and do in Shunesein depends on the **Role** your account has been assigned. An administrator manages roles from the Access Control section (see Chapter 9). Out of the box, the system includes these roles, each with a different starting set of permissions:

- **Owner** – full access to every feature, including user, role, and permission management. This role is specially protected: it cannot be renamed, deleted, or have its permissions changed by anyone, including another Owner.
- **Manager** – broad operational access across procurement, sales, inventory, and reporting.
- **Accountant** – finance, payments, and financial reporting focused access.
- **Warehouse Staff** – stock, transfers, adjustments, and inventory reporting.
- **Production Staff** – production batch access.
- **Sales Staff** – sales orders, invoices, and related reporting.
- **Cashier** – point-of-sale style payment recording.

An administrator can create additional custom roles and choose exactly which permissions each one has. Screens and buttons for actions you don't have permission for are simply unavailable to you; if you believe you should have access to something, ask an administrator to review your role.

Note: Throughout this manual, each feature notes which permission is required to create, edit, or delete records in it. Viewing/reading a list is usually available to any signed-in user, even without the specific management permission – it's the write actions (create, edit, delete, import, change status) that are gated.

2. Dashboard

The Dashboard is the home screen and gives every signed-in user (regardless of role) an at-a-glance summary of the business right now. It updates automatically each time you open it.

2.1 What's on the Dashboard

- **Today's activity** – sales, purchases, and finished production recorded today.
- **Pending purchase orders** – a count of purchase orders still awaiting receipt.
- **Accounts** – every cash/bank account and its current balance, plus the combined total.
- **Outstanding balances** – total amount owed to you by customers, and total you owe suppliers.
- **Aging** – the same outstanding balances broken into how overdue they are: 0–30, 31–60, 61–90, and over 90 days.
- **Low stock** – a count of products at or below their minimum stock level, with the ten most urgent shown.
- **Stock by category** – your top 8 product categories by total inventory value.
- **Best-selling products** – your top 5 products by quantity sold in the last 30 days.
- **6-month trend chart** – sales, expenses, cash received, cash paid out, and net cash flow for the current month and the five before it.

Note: "Today's sales" is shown net of discount and excludes tax, while "today's purchases" includes tax. This is intentional (sales tax collected is not your revenue; purchase tax is part of what you paid), but it means you should not directly compare the two figures side-by-side without keeping this in mind. The Reports chapter covers the fully itemized figures.

Note: A product counts as "low stock" once its quantity is equal to or below its minimum stock level – not only when it drops strictly below it. Products with no minimum level set are never flagged, so make sure minimum stock levels are set on products you want to monitor (see 3.2 Products).

3. Master Data

Master Data holds the reference records that the rest of the system is built on: what you sell, who you buy from and sell to, where you store stock, and how you get paid. Every Master Data screen shares the same look and feel: a searchable, sortable list with pagination, a form for creating or editing a record, CSV Import/Export buttons, and a row menu (the ... button on each row) for Edit and Delete. Creating, editing, deleting, and importing records requires the **Manage Master Data** permission; viewing the list is open to any signed-in user.

3.1 Categories

Simple groupings for products (e.g. "Green Tea", "Snacks"), used to organize the product list and to roll up inventory value and sales figures by category in reports. Each category just needs a unique name and an optional description.

3.2 Products

The product master record used everywhere – purchasing, production, sales, and inventory.

- **Identity:** Name (required), an optional Product Code and Barcode (each must be unique if set, but you may leave either blank on more than one product).
- **Classification:** Category (optional) and Product Type – every product must be marked either **Raw Material** or **Finished Goods**. This distinction is enforced during Production (see 6.1): a batch's raw material list can't include a Finished Goods item and vice versa.
- **Stock control:** Minimum Stock Level – set this so the product appears on the Dashboard's and Reports' low-stock views once it runs down to (or below) this quantity.
- **Status:** Active or Inactive.

Cost and selling price are **not** set on the main product form – use the **Set Price** action from the row menu instead, where you enter a Cost Price and a markup (either a fixed amount or a percentage); the system calculates the Selling Price for you. If you also maintain quantity-based pricing tiers for a product (e.g. a lower unit price at 100+ units), use the **Quantity Pricing** action on that row.

3.3 Quantity Pricing (Pricing Tiers)

A read-only list view of every quantity-break price configured across all products (From Quantity and the Unit Price that applies at or above it). Tiers themselves are set per-product from the Products page's Quantity Pricing action; this page requires the **Manage Price Lists** permission to access.

3.4 Suppliers & Customers

Contact and account records for the businesses you buy from and sell to: name, contact person, phone, email, address. Both track an **Outstanding Balance** that the system keeps up to date automatically as you record purchase vouchers/sales invoices and payments against them – you should not need to edit this figure by hand. Customers additionally have a **Credit Limit** field.

Note: Credit Limit is informational only: the system does not currently stop you from invoicing a customer who is already at or beyond their limit. Treat it as a figure to check manually before approving a large order for a customer who is close to it.

3.5 Warehouses

The physical (or logical) storage locations that all stock quantities are tracked against. Every stock balance in the system is a quantity *of one product, in one warehouse* – the same product can show different quantities in different warehouses.

3.6 Accounts

Your cash and bank accounts (e.g. "Petty Cash", "KBZ Bank – Current Account"). Each has a running Balance that is updated automatically whenever a payment, income/expense entry, or fund transfer is recorded against it. See Chapter 8 (Finance) for how these entries are made, and the Cash & Bank Book report (11.4) to see an account's full transaction history.

3.7 Payment Methods

The methods available when recording a payment (e.g. Cash, Bank Transfer, Mobile Wallet). Each has a unique Code, a Name, an Active flag, and a "Counts as Cash (POS drawer)" flag used to distinguish cash-in-hand payment methods from others for cash-drawer reconciliation purposes.

3.8 Product Types

A fixed, non-editable reference list containing exactly two values: **Raw Material** and **Finished Goods**. Every product must be assigned one of these. This list cannot be added to, renamed, or removed from the interface – it is intentionally locked down because Production logic depends on exactly these two categories.

3.9 Print Page Setups

Layout templates used when printing documents (invoices, purchase orders, etc.) – page size, margins, and similar settings. Exactly one setup can be marked as the **default** at a time; marking a different one as default automatically un-marks the previous one. Requires the **Manage Settings** permission to create or edit.

4. Procurement

Procurement covers buying from suppliers: raising a purchase order, receiving the goods, and handling anything you send back. Creating, editing, deleting, or changing the status of any record in this chapter requires the **Manage Procurement** permission; viewing lists is open to any signed-in user.

4.1 Purchase Orders

A Purchase Order (PO) records what you intend to buy from a supplier before it physically arrives. A PO moves through a status lifecycle:

- **Pending** → **Approved** → **Received**, or **Cancelled** at any point.

You can only edit or delete a PO while it is still **Pending**. Once approved, use a Purchase Voucher (below) to record what was actually received against it.

Note: The status dropdown itself doesn't strictly enforce the order above beyond blocking further changes once a PO is Cancelled or Received – take care to move POs through Pending → Approved → Received in the intended order rather than relying on the system to prevent an out-of-sequence change.

4.2 Purchase Vouchers (Goods Receipt)

A Purchase Voucher records goods actually received from a supplier – the counterpart to a Sales Invoice on the buying side. Creating one adds the received quantities to stock in the chosen warehouse and increases the supplier's Outstanding Balance by the voucher's net amount. If the voucher references a Purchase Order, that order's status is set to Received.

- You can record a **lot number** and **expiry date** per line for goods that need batch/expiry tracking (feeds the Expiry Report, 11.18).
- You can rate the receipt's **quality** (Good, Minor Issues, or Rejected) – this feeds the Supplier Scorecard report (11.17).
- Deleting a voucher is blocked while any payment has been recorded against it – remove the payment(s) first. If allowed, deleting reverses the stock addition, the supplier's balance, and reopens a linked PO back to Approved.
- Deleting is also blocked if the received stock has already been used/moved elsewhere, since there would no longer be enough of it to safely reverse.

Note: Unlike a Sales Invoice, a Purchase Voucher can currently still be edited after a payment has been recorded against it. Be cautious about changing quantities or amounts on a voucher that already has payments – double-check the resulting payment status and outstanding balance afterward.

4.3 Purchase Returns

Use a Purchase Return (debit note) to send goods back to a supplier. It deducts the returned quantity from stock and reduces the supplier's Outstanding Balance. It is a single-step action with no approval workflow, and requires at least one line item. If there isn't enough stock on hand to cover the return quantity, it will be rejected.

5. Sales

Sales covers the customer-facing side: quoting/booking an order, invoicing and shipping stock against it, and handling customer returns. Creating, editing, deleting, or changing the status of any record in this chapter requires the **Process Sales** permission; viewing lists is open to any signed-in user.

5.1 Sale Orders

A Sale Order records what a customer has agreed to buy before it's invoiced and shipped. It moves through a status lifecycle:

- **Pending** → **Approved** → **Invoiced** → **Delivered**, or **Cancelled** at any point before Invoiced/Delivered.

You can only edit or delete a Sale Order while it is **Pending**. Once **Approved**, use the **Convert to Invoice** action to turn it into a Sales Invoice – this is only available for orders that have reached Approved.

Note: As with Purchase Orders, the status control doesn't strictly enforce the intended order beyond blocking changes once Cancelled, Invoiced, or Delivered – move orders through the stages in sequence rather than relying on the system to catch an out-of-order change.

5.2 Sales Invoices

A Sales Invoice ships stock to a customer and bills them for it – this is the step that actually reduces stock on hand and increases the customer's Outstanding Balance.

- You may create an invoice directly, or from an approved Sale Order via Convert to Invoice.
- **Stock is checked at the moment you save:** if any line requests more than what's currently available in the chosen warehouse, the whole invoice is rejected with a message telling you exactly how much is available versus how much you asked for, and nothing is saved.
- You can only edit an invoice while its payment status is still **Unpaid** – once any payment has been recorded, the invoice is locked against further edits.
- You cannot change an invoice's warehouse after creating it – delete it and recreate it instead if the wrong warehouse was selected.
- Deleting an invoice is blocked while it has any recorded payments; remove those first. A clean delete reverses the stock, the customer's balance, and reopens a linked Sale Order back to Approved.

Note: Because stock is checked and reserved at save time, always enter the final, correct quantities before saving rather than expecting to "adjust down" after a rejection and resubmit with the same over-large quantity on other lines – the whole save is rejected together.

5.3 Sales Returns

Use a Sales Return (credit note) to take goods back from a customer. It adds the quantity back into stock and reduces the customer's Outstanding Balance. Like Purchase Returns, this is a single-step action with no approval workflow and requires at least one line item; it does not have to be linked to a specific original invoice. Deleting a return is blocked if the restocked goods have already moved on (e.g. already sold again) since there wouldn't be enough left to safely reverse.

6. Inventory

Inventory covers everything that changes how much stock you have and where it is: turning raw materials into finished goods, moving stock between warehouses, correcting counts, and reviewing the full transaction history of any product. Creating or updating records in this chapter requires the **Manage Production** permission (for Production) or the **Manage Stock** permission (for Transfers, Adjustments, and Stock Count); viewing is open to any signed-in user, though Stock Ledger specifically requires **View Reports**.

6.1 Production

Records converting Raw Material stock into Finished Goods stock through a manufacturing batch. A batch moves through a strict status lifecycle, and only exactly these transitions are allowed – anything else is rejected:

- **Pending** → **In Progress** → **Completed** or **Cancelled**
- **Pending** → **Cancelled** (no stock has moved yet at this stage)

When you create a batch, every raw material line must be a product marked as Raw Material type (not Finished Goods). Moving a batch to **In Progress** deducts the listed raw materials from stock (blocked if there isn't enough on hand). Moving it to **Completed** requires you to specify the Finished Goods produced (at least one line, each a product marked Finished Goods) – you can record a lot number and expiry date per finished good here too. Cancelling a batch that was already **In Progress** reverses the raw-material deduction back into stock.

6.2 Stock Transfers

Moves stock from one warehouse to another. The source and destination warehouses must be different. A transfer moves through a strict status lifecycle and no step may be skipped:

- **Pending** → **Approved** → **Received** → **Completed**

Stock is deducted from the source warehouse when the transfer reaches **Received** (blocked if there isn't enough available), and added to the destination warehouse when it reaches **Completed**.

6.3 Stock Adjustments

A direct correction to a product's stock quantity in a warehouse – use this for damaged, missing, expired, or otherwise miscounted stock. Enter a positive quantity to increase stock or a negative quantity to decrease it, and choose a Type (Damaged, Missing, Expired, or Manual) to categorize the reason. Adjustments apply immediately with no approval step. A decrease is rejected if it would take the product's stock below zero.

6.4 Stock Count

A guided physical stock-take workflow: pick a warehouse, and the system shows you every active product's current recorded quantity so you can enter what you actually counted. When you submit:

- Only products where your count **differs** from the system's recorded quantity are recorded as an adjustment – matching items are left alone.
- For each difference, the product's stock is **set** to the quantity you counted (not added to or subtracted from the old figure).

- One adjustment record is created automatically, numbered like SC-`<timestamp>`, grouping all the discrepancies from that count session.

6.5 Stock Ledger

A per-product, per-warehouse running balance – pick a Product and a Warehouse (both required) and a date range, and see every transaction affecting that specific combination in chronological order with a running balance column, starting from an automatically calculated opening balance. If you leave the date range blank, it defaults to today only. This is different from the Stock Movement report (11.3), which shows the full audit trail across every product and warehouse rather than a running balance for one specific pair.

Note: Across every stock-reducing action in the system – invoicing, purchase returns, transfers, production, and manual decreases – stock is never allowed to go negative. If an action would take a product below zero in a warehouse, it is rejected outright rather than allowed to partially complete.

7. Delivery

Delivery tracks the physical shipment of already-invoiced goods to customers – it is a logistics record layered on top of Sales Invoices, not a second stock-moving step. Creating or updating a delivery requires the **Manage Delivery** permission; viewing is open to any signed-in user.

A single delivery run can cover one or more Sales Invoices – useful when a driver is carrying several customers' orders in one trip. When creating a delivery you attach the invoice(s) it covers; the vehicle and driver details are recorded for reference.

A delivery moves through a status lifecycle:

- **Pending** → **Shipped** → **Delivered** or **Failed**
- **Pending** → **Failed** (a delivery can fail before it even ships)

Delivered and **Failed** are both final – a delivery cannot be moved to any other status once it reaches either one.

Note: Marking a delivery as Delivered or Failed does not itself touch stock or customer balances – that already happened when the underlying Sales Invoice was created. Delivery status is purely a record of whether the goods physically arrived.

8. Finance

Finance covers money in and out that isn't a straightforward sales or purchase payment: other income and expenses, moving funds between your own accounts, and recording payments received from customers or made to suppliers. Creating, editing, or deleting records here generally requires the **Manage Finance** permission (Income & Expense, Fund Transfers) or the **Manage Payments** permission (Payments); viewing is open to any signed-in user.

8.1 Income & Expense

Records one-off or recurring income and expense entries against a category (e.g. "Rent", "Staff Salaries", "Other Income") and an account. The amount must be greater than zero. Recording an income entry increases the chosen account's balance; an expense entry decreases it. Deleting an entry reverses that balance change. Income/Expense Categories themselves are managed from Master Data (each just needs a Name and a Type of Income or Expense).

8.2 Fund Transfers

Moves money between two of your own accounts (for example, depositing cash into the bank). The source and destination accounts must be different, the amount must be greater than zero, and the transfer is rejected if the source account doesn't have enough balance to cover it. Deleting a transfer reverses both account balances – this is blocked if the destination account no longer has enough balance to reverse (i.e. the money has since been spent elsewhere).

8.3 Payments

Payments record money changing hands against a specific Purchase Voucher or Sales Invoice – a customer paying you, or you paying a supplier.

- The amount must be greater than zero, and cannot exceed what's still outstanding on that voucher/invoice – the system tells you the remaining balance if you try to overpay.
- You can optionally select which Account the money is going into or out of; the account's balance is updated automatically if you do.
- Once payments bring the total paid up to (or effectively at) the full net amount, the voucher/invoice's payment status becomes **Paid**; a partial payment sets it to **Partial**.
- Deleting a payment reverses the account balance, the customer/supplier balance, and recalculates the payment status.

8.4 Cash & Bank Book (Account Ledger)

Pick an Account to see its complete running history – every payment, income/expense entry, and fund transfer that touched it, in chronological order with a running balance, starting from an automatically calculated opening balance for the date range you choose.

9. Access Control

Access Control is where administrators manage who can sign in and what they're allowed to do. Everything in this chapter requires the **Manage Users** permission (for Users) or the **Manage Roles** permission (for Roles/Permissions).

9.1 Users

Each user account has a unique Username, a password, a Display Name, a Role, a Status (Active, Inactive, or Suspended), and a Timezone.

- Setting a user's status to Inactive or Suspended immediately blocks them from signing in, even with the correct password.
- When editing an existing user, leaving the password field blank keeps their current password unchanged – you only need to fill it in if you want to reset it.
- Exporting users to CSV never includes password data, and importing a CSV of users never overwrites an existing user's password, even if the file happens to contain a password-like column.

9.2 Roles & Permissions

A Role is a named bundle of permissions (e.g. "Warehouse Staff"). Open a role to see and change exactly which permissions it grants – saving replaces the role's entire permission set with your new selection.

Note: The built-in **Owner** role is permanently protected: it cannot be renamed, deleted, or have its permissions changed by anyone at all, including another Owner-level user. This guarantees there is always at least one fully-privileged role available to recover access with.

Every other role, including any you create yourself, can be freely renamed, have its permissions changed, or be deleted – though a role currently assigned to one or more users cannot be deleted until those users are moved to a different role first.

10. Audit Log

The Audit Log is a chronological record of who did what, and when. Viewing it requires the **View Audit Log** permission.

It records: every create/update/delete across Master Data and Users; every Sale/Purchase Order, Invoice, Voucher, and Return created, updated, or deleted; every Production Batch and Stock Transfer created or moved to a new status; every Stock Adjustment; every Delivery created or updated; every Income/Expense entry, Fund Transfer, and Payment created or deleted; every sign-in, failed sign-in attempt, and sign-out; and every print action.

You can filter the log by user, by the type of record affected, by action, by a date range, or search free text. Each entry shows what changed – for an edit, both the before and after values; for a delete, the values the record had just before it was removed.

Note: Reassigning a role's permissions (see 9.2) is currently the one significant action that does **not** produce an Audit Log entry. Keep this in mind if you are reviewing the log for security purposes after a permissions change.

11. Reports

This chapter is a complete reference for every report in Shunesein – what question it answers, how to filter it, what you will see, and anything worth knowing about how to read the numbers correctly. Reports are read-only: nothing here changes any data.

11.1 Two Levels of Access, and Conventions Used Throughout

Reports fall into two permission tiers:

- **Operational reports** (Sections 11.2–11.4, 20 reports) – require the **View Reports** permission. These cover stock, production, purchasing, sales operations, and delivery – day-to-day operational visibility that doesn't expose money figures like margins or account balances.
- **Financial reports** (Section 11.5, 16 reports) – require the separate **View Financial Reports** permission (on top of View Reports). These expose margins, profitability, tax, statements of account, and the general ledger – sensitive figures that not every operational role should necessarily see.

A few conventions apply across most reports and are not repeated in every section below:

- **Date range** – almost every report has From/To date fields. If you leave them blank, the report defaults to **month-to-date**: the 1st of the current month through today.
- **Compare with previous period** – three reports (Purchase Summary, Sales Summary, and Profit & Loss) offer a Compare toggle. Turning it on adds the equivalent totals for the period immediately before your selected range (same number of days), plus a percentage change, so you can see growth or decline at a glance.
- **Filters** – where a report can be narrowed to one warehouse, product, customer, or supplier, that filter is optional unless stated otherwise.

11.2 Inventory & Production Reports

Ten reports covering what you have in stock, what it's worth, how it's moving, and what your production is producing.

Current Stock

Answers: How much stock do we have right now, and what is it worth?

Filter by: Warehouse (optional – leave blank to see every warehouse)

You'll see: One row per product/warehouse combination: quantity on hand, cost price, and the resulting stock value (quantity × cost price), plus a grand total value.

Low Stock

Answers: Which products are we at risk of running out of, and what would it cost to restock them?

Filter by: Nothing – always shows every warehouse.

You'll see: Every product/warehouse combination at or below its minimum stock level, sorted by the biggest shortfall first, with a suggested reorder cost for each and a grand total reorder budget.

Note: Only products with a Minimum Stock Level greater than zero can ever appear here – make sure that field is set on Master Data > Products for anything you want this report to watch.

Stock Movement

Answers: What exactly moved in or out of stock, when, and why?

Filter by: Product, Warehouse, Movement Type, and a date range; sortable and paginated for browsing large histories.

You'll see: Every individual stock transaction across the whole business: the product, warehouse, quantity change, its estimated value, and a reference back to the source document (purchase voucher, sales invoice, transfer, adjustment, or production batch number).

Note: This is the full audit trail across everything, valued at today's cost price. If you want a running balance for one specific product in one specific warehouse instead, use the Stock Ledger under Inventory (see Section 6.5) rather than this report.

Production Summary

Answers: What did we produce, and did the value produced exceed the cost of what went into it?

Filter by: Date range; group by Day or by Month.

You'll see: Batch counts (started, completed, cancelled) per period; finished goods output valued at the batch's actual recorded production cost; and a yield figure comparing that output value against the raw-material input cost for the same period.

Inventory Valuation

Answers: How is our inventory value spread across categories and warehouses?

Filter by: Warehouse (optional).

You'll see: Total quantity and value broken down by product category, and separately by warehouse, plus a grand total – a rolled-up companion to the Current Stock report, useful for a quick balance-sheet-style check.

Slow-Moving Stock

Answers: What stock has been sitting untouched, and how much money is tied up in it?

Filter by: Number of days of inactivity to count as "slow" (defaults to 90); Warehouse (optional).

You'll see: Every product still in stock that hasn't had any stock movement in at least that many days, when it last moved, and its tied-up value. Products that have never moved at all are shown as maximally stale.

ABC Analysis

Answers: Which products drive most of our revenue, and which are low-impact?

Filter by: Date range.

You'll see: Every product ranked by revenue in the period, classified into Class A (the top group making up 80% of revenue), Class B (the next 15%), or Class C (the remaining 5%), with each product's share and running cumulative share shown.

Note: A product's class depends on the whole product mix that period, not a fixed revenue target – the same product could rank as Class A one month and Class B the next if what else sold changes around it.

Stock Transfer Register

Answers: What stock has moved between our own warehouses, and what is it worth?

Filter by: Date range, Source Warehouse, Destination Warehouse, and Status.

You'll see: Every transfer with its status, item count, total quantity moved, and estimated value, plus overall totals.

Stock Adjustment Report

Answers: What inventory write-offs or corrections have we recorded, and what did they cost us?

Filter by: Date range, Warehouse, and adjustment Type (Damaged/Missing/Expired/Manual).

You'll see: Every adjustment line with its value impact (negative for stock removed), plus a breakdown by type so you can see, for example, how much was lost to damage versus expiry.

Expiry Report

Answers: Which batches of goods are approaching, or have already passed, their expiry date?

Filter by: Number of days ahead to look (optional – leave blank to see every lot with an expiry date on file, past or future).

You'll see: Every purchased or produced lot with an expiry date, its warehouse, quantity, and days until (or since) expiry, plus counts of lots expiring soon and already expired.

Note: This report lists lots as they were originally received or produced – it does not track how much of a specific lot has since been sold, because stock is deducted from the overall product total rather than from a specific lot. Treat the quantity shown as the original batch size, not necessarily what's still physically left of it, and always confirm against Current Stock before making a disposal decision.

11.3 Purchasing Reports

Six reports covering what you're buying, from whom, and how reliably your suppliers perform.

Purchase Summary

Answers: How much did we spend on purchasing this period, and with whom/on what?

Filter by: Date range; Compare with previous period.

You'll see: Total vouchers, gross amount, discounts, tax, and net amount, plus a breakdown by supplier and separately by product.

Open Purchase Orders

Answers: Which purchase orders are still open, and how much has been received against each?

Filter by: Supplier, Status.

You'll see: Every purchase order that hasn't reached Received or Cancelled, with the ordered amount, the amount received so far, the open (still pending) amount, and how many days old the order is.

PO Variance

Answers: For orders suppliers have actually invoiced against, did they bill us what we ordered?

Filter by: Date range, Supplier.

You'll see: Each purchase order that has at least one voucher against it, comparing the ordered amount to the vouchered amount, the variance, and a flag for orders with a variance over 5%.

Note: A purchase order with zero vouchers recorded against it will not appear here at all – look at Open Purchase Orders instead for those.

Supplier Price Trend

Answers: Has what we pay for a specific product been creeping up over time?

Filter by: Product (required – you must choose one product to run this report).

You'll see: Every purchase of that product across its entire history, in order, with the unit price each time, plus the minimum, maximum, average, and the percentage change from the first purchase to the most recent.

Note: This pulls the entire purchase history for the product with no date filter, and blends across every supplier who has sold you that product – each row does show which supplier it came from, but the summary figures are not split out per supplier.

Supplier Scorecard

Answers: How reliable and how good is each supplier?

Filter by: Date range.

You'll see: Per supplier: total spend, an on-time delivery rate (based on vouchers whose purchase order had an expected date), and a quality rate based on how the receipts were rated (Good / Minor Issues / Rejected) when recorded.

Note: If a supplier's on-time rate shows as blank/not available rather than 0%, that means none of their vouchers in this period had an expected date to measure against – it means "no data to score," not "always late."

Purchase Returns

Answers: What have we sent back to suppliers, and how much value does that represent?

Filter by: Date range.

You'll see: Every purchase return with its reason and amount, plus a breakdown by supplier and overall totals.

11.4 Sales & Delivery Reports

Four reports covering outstanding sales orders, delivery reliability, and a combined document index across both sides of the business.

Sales Order Backlog

Answers: Which customer orders are still open, and how much of each has actually been invoiced?

Filter by: Customer, Status.

You'll see: Every sale order that hasn't reached Delivered or Cancelled, with the order amount, the amount invoiced so far, the open (not yet invoiced) amount, and its age in days.

Delivery Performance

Answers: How reliably are we completing deliveries?

Filter by: Date range.

You'll see: Every delivery run with its status, a count of deliveries in each status, and overall delivered-rate and failed-rate percentages.

Document Register

Answers: A single combined list of every purchase order, purchase voucher, sale order, and sales invoice in a period – useful for a month-end review or an audit sample.

Filter by: Date range; optionally narrow to just one document type.

You'll see: Each document's type, number, the customer/supplier it's with, its date, status, and amount, plus totals per document type.

Note: For purchase vouchers and sales invoices, the "Status" column in this particular report shows the *payment* status (Paid/Unpaid/Partial), while for purchase and sale orders it shows the normal workflow status – the same column means something slightly different depending on the row's document type.

Sales Returns

Answers: What are customers sending back, and which customers/reasons dominate?

Filter by: Date range.

You'll see: Every sales return with its reason and amount, plus a breakdown by customer and overall totals.

11.5 Financial Reports

Sixteen reports requiring the View Financial Reports permission – profitability, tax, statements of account, cash flow, and the general ledger.

Sales Summary

Answers: How much did we sell this period, net of discounts and tax, and what's the margin?

Filter by: Date range; Compare with previous period.

You'll see: Invoice count, gross sales, discounts, tax collected, net sales (which deliberately excludes tax – tax collected isn't your revenue), estimated cost and gross margin, plus breakdowns by product and by customer.

Note: Margin figures across this and other sales-based reports are estimated using each product's *current* cost price, not the cost that was actually in effect at the time of the original sale – if you've changed a product's cost price recently, historical margin figures will shift to reflect today's cost, not the past one.

Sales by Category

Answers: Which product categories are driving our revenue and margin?

Filter by: Date range.

You'll see: Total quantity sold, revenue, estimated cost, and margin per product category (products with no category are grouped as "Uncategorized"), plus overall totals.

Payment Method Analysis

Answers: How are customers actually paying us – cash, bank transfer, card, etc.?

Filter by: Date range.

You'll see: Transaction count and total amount per payment method, and each method's share of the total. This looks only at how customers pay you – it does not include payments you make to suppliers.

Salesperson Performance

Answers: How much is each sales rep selling?

Filter by: Date range.

You'll see: Invoice count, net sales, and average invoice value per salesperson, with invoices that have no salesperson recorded broken out separately as "Unassigned" rather than silently left out of the totals.

Outstanding Balances

Answers: Who owes us money, who do we owe, and how overdue is each balance?

Filter by: Nothing – always reflects the current moment.

You'll see: Every customer and supplier with a balance still open, aged into 0–30, 31–60, 61–90, and over-90-day buckets, plus a running check that these independently-calculated ages add up to the same total shown on the customer/supplier's own record.

Note: If that consistency check ever shows a mismatch, treat it as a signal to investigate – it usually means a payment exists that wasn't correctly linked to the invoice or voucher it belongs to, not something to dismiss.

Profit & Loss

Answers: Were we profitable this period, and where did the money go?

Filter by: Date range; Compare with previous period.

You'll see: A standard top-to-bottom statement: gross sales, discounts, net sales, cost of goods sold, gross profit and margin, operating expenses by category, operating profit, other income, and net profit and margin.

Note: Cost of Goods Sold here is an estimate – quantity sold multiplied by each product's current cost price – because the system does not capture a precise historical unit cost at the moment of every individual sale. Treat this P&L as a very good working estimate rather than an audited, exact figure if product costs have changed recently.

Tax / VAT Summary

Answers: How much tax have we collected versus paid, and what's owed (or reclaimable)?

Filter by: Date range.

You'll see: Sales tax collected, purchase tax paid, and the net payable (or reclaimable, shown negative) for the period overall and broken down month by month.

Expense Report

Answers: What income and expense entries have been recorded, and can I drill into them?

Filter by: Date range, Type (Income or Expense), Category, Account.

You'll see: Every individual entry with its category, type, amount, and account, plus totals by category and overall income/expense/net figures – a detailed, filterable companion to the rolled-up expense line in the Profit & Loss report.

Customer Statement

Answers: What's the full transaction history for one specific customer, and what do they currently owe?

Filter by: Customer (required); date range.

You'll see: A running statement, like a bank statement, starting from an opening balance: every invoice (a debit) and payment (a credit) in order, with a running balance after each one, ending in a closing balance.

Supplier Statement

Answers: What's the full transaction history with one specific supplier, and what do we currently owe them?

Filter by: Supplier (required); date range.

You'll see: The same running-statement format as the Customer Statement, but for a supplier: vouchers and payments in order with a running balance.

Cash Flow Statement

Answers: How much actual cash came in and went out this period, and where do we stand right now?

Filter by: Date range.

You'll see: Cash in (customer payments plus other income) and cash out (supplier payments plus expenses), the net difference, a month-by-month breakdown, and your current total cash/bank balance across all accounts.

Note: This is based on actual payment dates – real cash movement – not invoice or voucher dates, so it will not match the Profit & Loss report line for line; that's an accrual-based view, this is cash-based. Transfers between your own accounts are deliberately left out since they don't represent money entering or leaving the business. The "current balance" figure always reflects right now, regardless of what end date you chose for the rest of the report.

Fund Transfer Register

Answers: What money movements have happened between our own accounts?

Filter by: Date range.

You'll see: Every internal transfer with the source and destination accounts, amount, and any note, plus totals.

Chart of Accounts

Answers: What is the balance of every account in our general ledger as of a given date?

Filter by: As Of date (defaults to today).

You'll see: Every ledger account, its type, and its balance as of that date, including accounts with no activity at all.

Trial Balance

Answers: Does our general ledger balance – do total debits equal total credits?

Filter by: As Of date (defaults to today).

You'll see: Every ledger account that has activity, its net debit or credit balance, and whether the totals across all accounts balance.

Note: Because every entry the system posts to the ledger is always balanced by construction, this report should always show "balanced." If it ever doesn't, that points to a data-integrity problem worth raising with your system administrator rather than a normal business condition.

Balance Sheet

Answers: As of a given date, what do we own, what do we owe, and what's our equity?

Filter by: As Of date (defaults to today).

You'll see: Assets, Liabilities, and Equity, each totaled, plus a Retained Earnings line and a check that Assets equal Liabilities plus Equity.

Note: There is no year-end "closing" step in this system, so Retained Earnings is always calculated fresh as the running total of all income minus all expenses since the system began – it is not a figure that gets locked in at the end of a financial year the way it would in some traditional accounting software.

Journal Register

Answers: What has actually been posted to the general ledger, line by line?

Filter by: Date range; optionally by the type of source document that generated the entry.

You'll see: Every journal entry with its date, source, description, and the individual debit/credit lines making it up – the most detailed view available, useful for auditing or tracing a figure back to where it came from.
